Claim IQ

Decision Intelligence Platform for Malaysian TPA Claims Adjudication

– SYSTEM ANALYSIS DOCUMENTATION (SAD) –

GROUP: AmaChuuErs

Domain: Domain 2 - AI for Economic Empowerment & Decision Intelligence

Submitted: 26th April 2026

1. Executive Summary

Malaysia's private healthcare system is under severe financial stress. Medical claims costs rose an estimated 56% cumulatively from 2021 to 2023, with 2024 adding a further single-year spike of approximately 21.6% — while insurance premiums grew only 13.2% in the same period, creating a structural funding gap that is forcing double-digit premium hikes on millions of policyholders (Galen Centre, 2024; World Bank, 2026). At the centre of this crisis sits the claims processing pipeline — a fragmented, largely manual system relying on panel clinics, Third-Party Administrators (TPAs), and paper-based adjudication workflows that are slow, fraud-prone, and opaque.

ClaimIQ is a next-generation AI-powered TPA platform that automates the entire outpatient claims lifecycle — from clinical document ingestion to AI-assisted adjudication decision — in under 90 seconds for standard clean claims, with a mandatory human Safety Freeze gate on all denial outcomes. Built on a multi-modal 'Double-Agent' architecture combining vision AI (document parsing) and a Large Language Model reasoning engine (GLM-powered adjudication), ClaimIQ delivers deterministic, auditable, and regulation-compliant claims recommendations at a fraction of today's manual cost.

Our two flagship innovations directly address Malaysia's most urgent regulatory and operational pressures:

- **BNM-Compliant Tiered Co-Pay Engine —** Automatically calculates and enforces the BNM mandated co-payment structure (effective 1 September 2024), applying the correct 5%-or-RM500 rule with all statutory exemptions computed in real time at the point of adjudication.
- **MC Analytics & Abuse Detection Engine —** Identifies 'MC Mill' clinics and habitual sick-leave abusers by analysing Medical Certificate (MC) issuance patterns against ICD-10 diagnosis codes, weekday distribution, and patient-visit frequency — generating HR-ready alerts without violating the Employment Act 1955.

ClaimIQ serves three customer segments: panel clinics (faster payment, AI-assisted coding), corporate employers / insurers (cost containment, fraud reduction), and TPAs (straight-through processing, regulatory compliance). Our SaaS model targets RM 2.4M ARR within 24 months of launch.

2. Product Overview & Solution

2.1 Eight-Step Autonomous Adjudication Pipeline

Every submitted claim flows through a sequential AI pipeline:

1. Document Triage — image quality validation, document type classification
2. Multi-Modal Evidence Extraction — Vision AI parses X-rays, lab reports, and invoices into structured JSON
3. Medical Coding — ICD-10 and CPT code assignment via GLM reasoning
4. Eligibility Scrubbing — panel membership, policy coverage, filing deadline validation
5. Clinical Cross-Reference — AI compares doctor's notes against objective lab/imaging findings to detect contradictions
6. Policy Adjudication (RAG) — FAISS-indexed policy documents provide context for GLM-based approval/denial decisions
7. Fraud Scoring — 7-pattern detection engine (phantom billing, upcoding, impossible timing, duplicate claims, etc.)
8. GP Advisory Generation — plain-language Bahasa Malaysia and English decision explanation for the clinic

2.2 Flagship Feature: BNM Tiered Co-Pay Engine

Fully implements the BNM September 2024 co-payment mandate — the most significant regulatory change to Malaysian health insurance in a decade:

- Applies 5% of claimable amount or RM 500 minimum deductible, whichever applies
- Automatically exempts: trauma/accident cases (ICD S/T codes), oncology/dialysis follow-ups (ICD C codes), government facility visits
- Co-pay amount computed at adjudication and surfaced on the Explanation of Benefits (EOB) for both clinic and employer
- Enables insurers to offer co-payment products up to 68% cheaper in premiums (BNM, 2024)

2.3 Flagship Feature: MC Analytics & Abuse Intelligence

A first-of-its-kind MC behaviour intelligence layer for Malaysian corporate health benefits:

- Tracks Monday/Friday MC clustering by patient IC and clinic
- Flags 'MC Mill' clinics where >80% of minor illness visits (J06.9 URTI, K29.7 Gastritis, R51 Headache) result in an MC
- Calculates per-patient and per-clinic MC Risk Scores (0.0–1.0)
- Generates HR alerts for employers without illegally altering payment (Employment Act 1955 compliant)
- Provides analytics dashboard: weekday distribution heatmap, frequent-patient leaderboard, same-day clinic spike alerts

2.4 Safety-First 'Doctor-First' Architecture

- All AI-assisted adjudication outputs are recommendations, not autonomous decisions. All denial outcomes are gated through a mandatory human TPA Processor review (Safety Freeze),

consistent with MMA guidance on clinical oversight and BNM's expectation of human accountability in automated financial decisions.

- Every AI decision logged with SHA-256 integrity hashes for immutable audit trails
- Full PDPA 2024 compliance: data minimisation, purpose limitation, audit log retention

2.5 Role-Based Multi-Portal System

- Clinic Portal: Submit claims, track status, receive AI-coded advisory, file appeals
- TPA Processor Portal: Review queue, approve/deny/raise RAI, view AI reasoning
- Fraud Analyst Portal: Flagged claims dashboard, provider risk leaderboard, fraud network graph
- System Admin Portal: User management, seed demo data, view audit logs, token cost tracking

2.6 Technology Stack

Layer	Technology
Backend API	Python 3.13, FastAPI, Uvicorn
AI Reasoning Engine	Z.AI GLM (GLM-4-Plus via OpenAI-compatible API)
Vision / Document AI	Google MedGemma, Gemini Vision
Vector RAG	FAISS (sentence-transformers, all-MiniLM-L6-v2)
Database	SQLite (production: PostgreSQL via Supabase)
Authentication	JWT HS256 (PyJWT), bcrypt password hashing
Frontend	Vanilla JS, CSS3 (glassmorphism dark UI), HTML5
Fraud Graph	NetworkX
Deployment	Uvicorn ASGI, background thread processing

3. Market Research & Market Dynamics

3.1 Problem Landscape

Malaysia's outpatient claims ecosystem suffers from four compounding structural failures:

Problem 1 — The Claims Cost Crisis

Malaysian Medical and Health Insurance (MHI) claims grew at approximately 11.6% per year between 2016 and 2019 (PMC / MNHA data), before accelerating sharply post-pandemic. In 2024 alone, single-year medical claims inflation reached approximately 21.6% — more than 8× Malaysia's general CPI — while premium growth lagged at around 13.2% (Galen Centre, 2024; World Bank, 2026). The primary driver is not cost-per-treatment but overutilisation, estimated to account for around 70% of cost growth, including unnecessary consultations, inflated billing, and widespread MC issuance. Note: A commonly cited '73% surge in two years' figure circulates in industry discussion but has not been independently verified to a single auditable source; ClaimIQ's business case is grounded instead in the verified 21.6% single-year figure and the documented MHI claims growth trend.

Problem 2 — Manual, Slow Adjudication

Standard outpatient claims adjudication in Malaysia currently takes 3–7 business days manually. Industry benchmarks show initial denial rates of approximately 11–12% globally (HFMA / Kodiak Solutions, 2024), most attributable to correctable administrative errors — wrong policy numbers, coding mismatches, missing documentation — that AI can resolve at the point of submission. Up to 65% of denied claims are never re-worked, meaning revenue is permanently written off (HFMA, 2024).

Problem 3 — Fraud, Waste & Abuse (FWA)

Healthcare FWA is conservatively estimated to account for 3–10% of total healthcare expenditure globally (EffectiveSoft / industry consensus). In Malaysia, documented 2024 cases include the SOCSO disability claims cartel and the Madani Medical Scheme fraud — both involving systematic false or inflated claims processed through manual pipelines with no automated cross-referencing. No existing Malaysian TPA platform applies real-time clinical cross-referencing at the point of adjudication.

Problem 4 — BNM Regulatory Compliance Burden

The BNM co-payment mandate (effective 1 September 2024) requires insurers offering new Medical and Health Insurance / Takaful (MHIT) products to include a minimum 5% or RM 500 co-payment per policy year, with defined statutory exemptions. Most legacy TPA platforms have no automated co-payment computation, creating compliance risk, manual calculation overhead, and potential premium leakage for every claim processed.

3.2 Market Sizing — Bottom-Up, Source-Referenced

ClaimIQ's market sizing is built bottom-up from verified public data, not top-down extrapolation. Each layer is clearly sourced and assumptions are stated.

Layer	Figure	Source & Methodology
Malaysia Health Insurance GWP (2024)	USD 915M (~RM 4.3B)	Grand View Research / Insurance Services Malaysia (Statista, 2024)
Private health insurance share of total	72.98% of GWP	Grand View Research Malaysia Health Insurance Market Report, 2024
MHI incurred claims ratio (2023, latest available)	65.9%	Insurance Services Malaysia / Statista, May 2024
Implied MHI claims pool (2024 est.)	~RM 2.07B	RM 4.3B GWP × 72.98% private × 65.9% claims ratio
Outpatient share of private MHI claims (est.)	~35–40%	WHO Malaysia Health System Review: private sector provides ~62% of ambulatory care; outpatient claims estimated at 35–40% of MHI pool
Estimated Malaysia outpatient MHI claims pool	~RM 720M–830M/year	Derived: RM 2.07B × 35–40%
Estimated outpatient claims volume	~18–22M claims/year	Derived: pool ÷ avg. outpatient claim value RM 38–45 (industry est.)
TPA-processed subset (panel employer claims, est. 40%)	~7–9M claims/year	Conservative: not all claims go through TPA; panel employer benefits est. 40% of private outpatient volume
SAM (ClaimIQ addressable)	~7–9M claims/year (RM 35–45M fee pool at RM 5/claim)	Bottom-up from TPA-processed volume × per-claim SaaS fee
SOM — Year 3 (5% share, conservative)	~400K claims/year → RM 2M revenue	Conservative 5% capture of SAM, consistent with pilot-first ramp

Key Assumption Caveat: Outpatient claims volume in Malaysia is not published as a single public figure. The 7–9M TPA-processed claims estimate is derived from the GWP-based claims pool and average claim value. ClaimIQ will validate this with pilot data from its first TPA partner before using it in investor-facing materials.

3.3 Market Dynamics & Regulatory Tailwinds

- Regulatory Tailwind — BNM Co-Pay Mandate (September 2024): Every TPA in Malaysia must now compute co-payments correctly on every new MHIT product claim. ClaimIQ is the only platform with a purpose-built, statute-aware co-pay engine.
- Medical Inflation Crisis → Cost-Containment Demand: With single-year claims inflation at 21.6%, every corporate CFO and insurer is actively seeking measurable cost containment. ClaimIQ's MC Analytics and fraud scoring are designed to produce reportable savings figures per client.
- Digital Transformation Momentum: Major Malaysian TPA players have launched digital submission apps but lack AI adjudication. ClaimIQ adds an intelligence layer above existing digitisation.
- AI Adoption Accelerating — But Implementation Lag Is Real: A 2025 Experian Health survey found 67% of healthcare organisations believe AI can improve claims, yet only 14% have implemented it. This gap represents ClaimIQ's near-term sales opportunity.
- PDPA 2024 Compliance Pressure: Stricter data handling requirements impose audit trail obligations on healthcare processors. ClaimIQ's immutable logs and role-based access controls are designed for this environment.

4. Value Proposition & Competitive Advantage

ClaimIQ redefines the economics of outpatient claims adjudication by replacing a 3–7 day human workflow with a <90 second AI pipeline while maintaining Doctor-First safety gates.

4.1 Stakeholder Value Matrix

Stakeholder	Key Pain Points Solved	Quantified Benefit
TPAs	Manual adjudication, compliance risk, audit burden	80% cost reduction per claim; BNM auto-compliance
Corporate Employers / Insurers	MC abuse, hidden FWA, no real-time visibility	8–15% projected outpatient cost reduction
Panel Clinics (GPs)	Coding errors, slow payment, opaque rejections	STP claims paid within 24h; ICD coding support

4.2 Defensible Competitive Advantages

- Regulatory Specificity — Co-pay engine built to Malaysian statute, not generic insurance rules
- Double-Agent AI Architecture — Separates vision extraction from reasoning to prevent hallucination compounding
- MC Intelligence — No competitor product in Malaysia specifically targets MC abuse pattern detection
- Safety-First Design — 'Doctor-First' freeze prevents the AI from autonomously denying claims without human oversight
- Full Auditability — SHA-256 hashed audit logs satisfy PDPA, BNM, and MMA compliance simultaneously

5. Competitor Analysis (Porter's Five Forces)

5.1 Competitive Landscape

Existing Malaysian TPA platforms such as WeCare TPA and IHP have launched digital apps that digitise claim submission and status tracking, but none have deployed real-time AI adjudication. ClaimIQ is the first AI-native TPA platform in Malaysia with built-in BNM co-pay automation, clinical cross-referencing, and MC abuse analytics — purpose-built for the post-September 2024 regulatory environment.

Dimension	Existing Malaysian TPAs	ClaimIQ
Adjudication Method	Manual / rule-based	AI + RAG + GLM reasoning
Co-Pay Computation	Manual / not automated	Automated, BNM-statute compliant
Fraud Detection	Post-payment audits	Real-time, clinical cross-reference

MC Abuse Monitoring	None / manual HR review	Automated pattern scoring dashboard
Decision Transparency	Opaque rejection letters	Full AI reasoning + GP advisory
Audit Trail	Paper/email records	SHA-256 immutable digital log
Processing Speed	3–7 days	<90 seconds

5.2 Porter's Five Forces Assessment

Force	Rating	Analysis
Threat of New Entrants	MEDIUM	Building a compliant AI claims platform requires deep regulatory, medical coding, and AI integration. Significant moat, but well-funded insurtech startups remain a future threat.
Bargaining Power of Buyers	MEDIUM-HIGH	Large TPAs have negotiating leverage. Mitigation: per-claim SaaS model aligns cost with value; switching costs are high once claims history is on-platform.
Bargaining Power of Suppliers	LOW	AI API costs are competitive (Z.AI GLM, Gemini). FAISS is open-source. No single supplier dependency.

Threat of Substitutes	LOW-MEDIUM	Manual processing is the current substitute — inefficient and expensive. Generic ERP systems cannot match ClaimIQ's medical-domain specificity.
Competitive Rivalry	LOW (Currently)	No Malaysian TPA platform offers real-time AI adjudication with BNM co-pay automation and MC abuse analytics. First-mover window: 18–24 months.

6. Business Model Canvas

6.1 Customer Segments

- TPA Operators (Primary B2B) — Mid-size TPAs processing 500–10,000 outpatient claims/month seeking to automate adjudication, reduce headcount cost, and achieve BNM compliance. Examples: MiCare, IHP, MediExpress tier operators.
- Corporate HR / Employee Benefits (Secondary B2B) — Companies with 100–5,000 employees managing panel clinic medical benefits who face rising MC abuse, unexplained cost spikes, and lack of visibility into claims data.
- Panel Clinics / GP Practices (Tertiary) — Private GP clinics seeking faster payment, ICD coding help, and lower administrative burden in submitting and tracking outpatient claims.

6.2 Revenue Streams

Revenue Stream	Pricing	Details

Per-Claim SaaS Processing Fee (Primary)	RM 5.00–8.00/claim	RM 5.00 standard; RM 8.00 complex (multi-modal evidence). Volume discounts: >2K claims → RM 4.00; >10K → RM 3.00
Platform Subscription (TPA Tier)	RM 1,500–12,000/month	Starter (500 claims); Professional (3,000 claims, MC Analytics); Enterprise (unlimited, white-label, API)
MC Analytics HR Module	RM 500/month	Per corporate employer: monthly MC behaviour report, HR-ready alerts, clinic risk rankings
API Access	RM 0.50/API call	For insurers embedding ClaimIQ adjudication into their own systems

6.3 Cost Structure

Cost Category	Year 1 (RM)	Year 2 (RM)
AI API Costs (GLM, Gemini)	48,000	96,000
Cloud Infrastructure	24,000	48,000
Engineering (2 FTE)	180,000	240,000
Sales & Business Development	60,000	120,000
Compliance & Legal	30,000	36,000
Operations	24,000	36,000

Total	**RM 366,000**	**RM 576,000**

6.4 Key Partners

- Z.AI / ILMU AI — Core LLM reasoning engine (GLM-4-Plus)
- Google — MedGemma / Gemini Vision for medical document parsing
- Panel Clinic Networks — Distribution and data partnerships for onboarding
- LIAM/MTA (Malaysian Insurance & Takaful Association) — Industry compliance alignment
- Bank Negara Malaysia — Regulatory sandbox engagement for co-pay automation
- Malaysian Medical Association (MMA) — Clinical standards validation for AI adjudication

6.5 Risk Assessment

Risk	Likelihood	Impact	Mitigation
AI model hallucination on clinical data	Medium	High	Double-Agent separation; Safety Freeze gate; human sign-off on all denials
BNM regulatory change	Low	High	Modular co-pay engine; statute references are parameterised, not hardcoded
TPA resistance to AI adjudication	Medium	Medium	Doctor-First architecture preserves clinical authority; AI = decision support, not replacement
Data breach / PDPA violation	Low	Critical	SHA-256 audit trail; role-based access; JWT session management; encrypted DB
GLM API downtime	Medium	High	Intelligent mock fallback; queue-based retry logic; auth-failure cooldown circuit breaker
MC false-positive alerts	Low	Medium	Risk scoring surfaced as advisory only; not used to withhold payment

7. Implementation & Financials

7.1 Go-to-Market Strategy

Phase	Timeline	Objectives
Phase 1 — Hackathon Validation	Month 0–1	Deploy live demo at UMHackathon 2026. Full end-to-end pipeline demonstration. Target 3 Letters of Intent from TPA or corporate HR attendees.
Phase 2 — Pilot	Month 2–6	Partner with 1 mid-size TPA and 10-15 panel clinics. Process 500-1,000 real outpatient claims. Target: STP rate ≥65%, processing time <2 minutes, zero wrongful denials.
Phase 3 — Commercial Launch	Month 7–12	Onboard 3 TPA clients and 50 panel clinics. Launch MC Analytics HR module to 5 corporate clients.

© 2026 ClaimIQ Team | Built for UMHackathon 2026 Final Round

		Revenue target: RM 600K ARR by Month 12.
Phase 4 — Scale	Month 13–24	Expand to Penang and Johor Bahru. White-label offering for insurers. Launch full Bahasa Malaysia interface. Revenue target: RM 2.4M ARR.

7.2 Implementation Milestones

Milestone	Timeline	Deliverable
Hackathon MVP Complete	Month 0	Full pipeline, 4-role portal, demo data
Pilot TPA Integration	Month 2	API integration with 1 TPA's claims system
BNM Co-Pay Certification	Month 3	Legal review of co-pay engine vs. BNM circular
MC Analytics Beta	Month 4	HR dashboard live with 2 corporate clients
SOC 2 / PDPA Audit	Month 6	External compliance audit completed
Commercial Launch	Month 7	3 TPA clients live, billing active
White-Label API	Month 12	First insurer API client live
Series A Fundraise	Month 18	RM 5M target for ASEAN expansion

7.3 Unit Economics — Why RM 5.00/Claim Is Justified

This is the most scrutinised number in any SaaS pitch deck. Here is the full cost build:

Cost Component	Per-Claim Cost (RM)	Notes
AI Token Cost (GLM + Vision)	~RM 0.000034	Measured from live DB: 260 claims, total token cost RM 0.00088. ~0.00034

		sen/claim. This is extraordinarily low.
Cloud Infra (server, DB, storage)	~RM 0.08	RM 1,000/month infra ÷ 12,500 claims/month at steady state
Human reviewer time (Safety Freeze gate)	~RM 0.60	Estimated 1 TPA processor reviews 15% of claims (denials/pends). 2 min/review × RM 18/hr blended rate ÷ 15% flag rate
Engineering support amortised	~RM 0.20	2 FTE engineering support across 12,500 claims/month
Compliance, legal, audit (amortised)	~RM 0.10	Annual compliance cost ÷ claims volume
Total Fully-Loaded Cost/Claim	~RM 0.98	Conservative estimate at 12,500 claims/month
Proposed Price to TPA (Standard)	RM 5.00	~5× cost multiple — standard SaaS gross margin
Gross Margin per Claim	RM 4.02 (~80%)	Consistent with B2B SaaS industry benchmarks

Customer Value Justification: A TPA paying RM 5.00/claim to ClaimIQ replaces a manual process estimated at RM 12–18/claim in staff time (industry TPA benchmarks). Net saving to the TPA: RM 7–13/claim. At 2,000 claims/month, that is RM 14,000–26,000/month in operational savings — against a ClaimIQ invoice of RM 10,000/month. ROI is positive from month 1.

7.4 Revenue Projections (3-Year) — Conservative Pilot-First Model

Projections are anchored to the sourced SAM estimate of 7–9M TPA-processed outpatient claims per year in Malaysia. Year 1 is intentionally conservative — revenue begins only after a paid pilot confirms STP rates and customer satisfaction. No white-label or ASEAN revenue is assumed before Year 3.

Metric	Year 1	Year 2	Year 3
TPA Clients (paying)	1 (pilot → commercial)	3	7

Claims Processed / Month	1,000–2,000 (pilot ramp)	8,000	25,000
Avg Revenue / Claim	RM 5.00	RM 5.00	RM 4.50 (volume discount)
Claim Processing Revenue	RM 75K–120K	RM 480K	RM 1.35M
Platform Subscription Revenue	RM 36K (1 TPA)	RM 144K (3 TPAs)	RM 396K (7 TPAs)
MC Analytics Module (corporate HR)	RM 12K (2 clients)	RM 60K (10 clients)	RM 180K (30 clients)
Total Revenue	RM 123K–168K	RM 684K	RM 1.93M
Total Operating Costs	RM 366K	RM 480K	RM 660K
EBITDA	-RM 198K–243K (investment phase)	RM 204K	RM 1.27M
EBITDA Margin	Negative (pre-revenue ramp)	30%	66%
SAM Share Captured	**<0.03%**	**~0.1%**	**~0.3%**

Honest Assessment: Year 1 is a loss-making investment year. This is realistic for a B2B SaaS selling into a conservative, compliance-sensitive sector. The path to profitability requires closing the first commercial TPA client by Month 7 and sustaining a STP rate ≥65% that demonstrably lowers the TPA's operational cost. The Year 3 RM 1.93M ARR target represents only ~0.3% of the conservative SAM — a highly achievable penetration rate for a product with clear ROI and regulatory tailwinds.

7.5 Key Financial Milestones

- Month 6: First paid pilot TPA live. 1,000–2,000 claims/month. Revenue: ~RM 7,000–10,000/month.
- Month 7: Full commercial contract signed with pilot TPA. STP rate validated ≥65%.

- Month 10: Second TPA client onboarded. MC Analytics HR module live with 3 corporate clients.
- Month 12: ~RM 120K–168K total year-end revenue. 2 TPA clients, ~3,000–4,000 claims/month.
- Month 18: 3 TPA clients, 8,000 claims/month. Monthly revenue RM 55K+. Approaching operational break-even.
- Month 24: 5 TPA clients, 15,000 claims/month. ARR ~RM 1.1M. Cash-flow positive. ASEAN feasibility review.
- Month 30: 7 TPA clients, 25,000 claims/month. ARR ~RM 1.93M. Series A fundraise if ASEAN expansion approved.

8. Regulatory Compliance Summary

Regulation	ClaimIQ Implementation
BNM Medical Insurance Co-Payment Circular (Sept 2024)	Purpose-built co-pay engine; 5%/RM500 rule; all statutory exemptions automated
Personal Data Protection Act (PDPA) 2024	SHA-256 audit logs; role-based access; data minimisation; encrypted storage
Employment Act 1955 (MC provisions)	MC Analytics generates alerts only; does not alter payment or deny leave
Malaysian Medical Association Standards	Doctor-First Safety Freeze; AI is decision-support only; all denials require human sign-off
Companies Act 2016 (financial records)	Immutable EOB records; token cost tracking; full financial audit trail

9. Conclusion

Malaysia's healthcare claims crisis is structural, urgent, and accelerating. The 2024 BNM co-payment mandate, surging medical inflation at 21.6%, and a documented fraud epidemic have created a market that actively needs what ClaimIQ delivers: fast, fair, auditable, and regulation-native AI adjudication.

© 2026 ClaimIQ Team | Built for UMHackathon 2026 Final Round

ClaimIQ is not a generic AI wrapper. It is a purpose-built Malaysian TPA intelligence platform with two flagship innovations — the BNM-Compliant Tiered Co-Pay Engine and the MC Abuse Analytics Module — that no existing competitor in the Malaysian market currently offers.

The technology is built and live. The regulatory case is proven. The market is ready.
